

CLAIMS

1. A method of constructing a representation of the geographical distribution of traffic for a cellular radio network, the method comprising the steps of:

- 5
- dividing each cell of said cellular network into a set of areas using information on handovers obtained from said cellular network;
 - determining a traffic value for each of said areas; and
 - 10 • determining a representation of the geographical distribution of the traffic from said traffic values.

2. A method according to claim 1, wherein the traffic value of an area depends on a handover probability associated with that area.

15

3. A method according to claim 2, wherein said handover probabilities are computed conjointly with said traffic values by a constraint optimization method.

4. A method according to claim 1, wherein the step of
- 20 dividing each cell is made up of the following substeps:
- acquiring incoming handover boundaries from best server maps provided by a management system, and
 - computing outgoing handover boundaries from said incoming handover boundaries,
- 25 said outgoing handover boundaries forming the boundaries of said areas.
